## **ABSTRACT**

We surveyed all known waterbird nesting colonies (locations from surveys conducted in 1976, 1978, 1983, 1990, and 1991-1999), and all areas en route between known locations (5,908 km), in south Louisiana during April, May, and June 2001. We conducted the surveys from fixed-winged amphibious aircraft configured to collect GIS-ready spatial data. Of 496 colony locations surveyed, 299 were inactive, 123 were active at the known location, 38 were active colonies in a new location (less than or equal to 1 km from old site), and 36 were new colonies in new locations. Most active colonies were in saline marsh (77), fresh marsh (48), or forested wetlands (44). We estimated a total of 215,249 pairs representing 25 bird species among the active nests. Dominant species in terms of number of colonies were great egret (86), snowy egret (71), and laughing gull (58); all other species were represented in less than 50 colonies. Species with greatest total numbers of bird pairs (all colonies) were sandwich terns (38,258), laughing gull (34,717), cattle egret (28,037), and white ibis (24,036); all others had less than 20,000 pairs. Of nine species that had shown declines in total numbers of birds from 1976 to 1990, seven continued to decline from 1990 to 2001, and two were stable or showed an increase in 2001. Two species showed increases over the three survey years: brown pelican (number of birds and number of colonies) and roseate spoonbill (number of colonies only). We calculated that 289 colonies may be present in unsurveyed habitats, which would bring the total number of active colonies in the study area up to 486. We note that the waterbird colony dataset in Louisiana is one of the best in North America, and we recommend that a detailed data analysis be conducted to determine if the population trends indicated in this report are statistically significant. Future management actions should be based on such an analysis.

## **INTRODUCTION**

Louisiana is one of the most important states in the southeastern United States in terms of number of colonies and total number of nesting colonial waterbirds (Martin and Lester 1990; Spendelow and Patton 1988). Nesting colonies in Louisiana were censused during previous studies in 1976 (Portnoy 1977), 1978 (Portnoy 1978a), 1983 (Keller et al. 1984), 1990 (Martin and Lester 1990), and partial surveys annually from 1991-1999 (Louisiana Department of Wildlife and Fisheries, Louisiana Natural Heritage Program [LNHP], unpublished data). A database with information from those surveys has been maintained by LNHP in Baton Rouge. The current study was conducted to update the status of previously recorded colony sites and to search the study area for new colonies. The information provided by these surveys is useful to resource managers and others interested in preservation, conservation, and management of Louisiana's dynamic avian and wetland resources.

## METHODS

### Study Area

We surveyed south Louisiana to the shoreline of the Gulf of Mexico, including forested wetlands, coastal marshes, and barrier islands (Figure 1). The northern boundary of our study area followed a line from the Texas border (Sabine River) near the town of Starks, Calcasieu Parish, Louisiana ( $30^{\circ} 17' N$ ,  $93^{\circ} 40' W$ ), to near the town of Bunkie, Avoyelles Parish, Louisiana ( $30^{\circ} 56' N$ ,  $92^{\circ} 03' W$ ), to the Mississippi border (Pearl River) about 3 miles east of the town of Pearl River, St. Tammany Parish, Louisiana ( $30^{\circ} 22' N$ ,  $89^{\circ} 40' W$ ). All habitats south of this line were considered in the habitat analysis (Figure 1). We did not attempt to survey known colony locations in coastal Mississippi, coastal Alabama, the Toledo Bend area of Louisiana, and other areas of north and central Louisiana that were surveyed in previous studies (Portnoy 1977, 1978a; Keller et al. 1984; Martin and Lester 1990).

### Survey Techniques

We conducted aerial surveys during two time periods, following protocols established during earlier studies (Martin and Lester 1990): (1) late April to early May, and (2) late May to early June. During the first time period we surveyed wading bird colonies in forested and scrub-shrub habitat. During the second time period we surveyed coastal marsh, barrier island, and scrub-shrub habitat for seabird and wading bird colonies. This survey schedule has been established in Louisiana as the optimum for catching the peaks of most nesting species while minimizing biases associated with prefledgling juveniles on the nests, although we acknowledge that we probably missed some early and late nesting birds (Martin and Lester 1990).

Ground surveys were conducted by refuge personnel (see Acknowledgments) within the following national wildlife refuges (NWRs): Sabine, Cameron Prairie, Lacassine, Mandalay, and Breton. All other colonies within the study area were surveyed by air. On Breton NWR (Chandeleur Islands) the ground surveys by refuge personnel did not include counts of herons, egrets, or gulls; only terns, skimmers, and pelicans were censused. Refuge personnel reported, however, that the following species were present, but uncensused, on Breton NWR: reddish egret, tricolored heron, white ibis, great egret, snowy egret, black-crowned night-heron, yellow-crowned night-heron, and laughing gull.

Aerial surveys were conducted from single-engine, fixed-winged amphibious aircraft (Cessna 185 and Cessna 206) owned and operated by the U.S. Department of the Interior (U.S. Geological Survey [USGS] and U.S. Fish and Wildlife Service). Each aircraft was configured with a voice/global positioning system(GPS)/moving map system (Hodges 1999) that links the aircraft's GPS, intercom system, and laptop computers so that each voice observation from the pilot or observer is assigned to a specific latitude, longitude, and time. The system also allowed geospatial points, the flight track of the aircraft, its present position, and the location of recent voice observations to be simultaneously displayed on a 1:250,000-scale digital map image in a remote computer monitor screen mounted on the aircraft's instrument panel. During the surveys we displayed all known colony locations from the historical database and navigated from one site to another at an altitude of approximately 50 m above the ground surface. Between known colony sites

we searched a 400-meter-wide swath (200 m on each side of the aircraft) for new colonies. If a new colony was observed en route, it was assigned a number, surveyed, and logged into the database. When the aircraft arrived at a known colony site, the site was searched to determine if the colony was active or inactive.

Survey crews consisted of 2 or 3 persons aboard the aircraft: a pilot, an observer, and sometimes a navigator. The observer in each plane was responsible for estimating the number of birds present, by species, for each colony. As in previous studies (Keller et al. 1984; Martin and Lester 1990) a colony was considered to include all groups of nesting birds within 1 km of each other unless they were previously identified in the colony database as separate groups. The navigator kept track of colony number, location, and colony history from hard copies of maps and datasets. As we approached a colony site, the navigator would announce the colony number, last known active date, and species present; this information would help us form a search image for that particular colony. Once a colony was located, one or more passes were made around or over the colony as necessary to obtain estimated counts of the number of nesting birds for each species. We recorded observations using the "Record" program of the voice/GPS/moving map system (Hodges 1999). Individual adult birds present on the colony were counted, and it was assumed each individual represented a breeding pair. Therefore, all counts presented in this manuscript refer to bird pairs.

We acknowledge that visibility biases likely affected our counts, especially for smaller and darker bird species, as discussed in other studies (Portnoy 1977; Erwin 1980, 1985, 1990; Martin and Lester 1990), but we assume that those biases were consistent among aerial surveys in Louisiana. As in previous studies, glossy ibis and white-faced ibis numbers were not distinguished, and were collectively referred to as "dark ibises." We also followed the protocol of previous studies in that if the colony location was different from the previous known location, but was within 1 km of the previous location, we retained the original colony number and recorded a new GPS location. If a colony was located greater than 1 km from a known location, we recorded the new location and assigned a new colony number.

#### Data Transcription and GIS Analysis

After each survey flight, voice observation data were transcribed by using the "Transcribe" program of the voice/GPS/moving map system (Hodges 1999) to digitize the voice observations and link them to GPS locations and time. We then imported all transcribed data into a geographical information systems (GIS) software package (ArcView 3.2a) to produce maps showing colony distribution and to perform other spatial relationship functions. Colony locations were displayed on a LANDSAT Thematic Mapper satellite image of south Louisiana (Braud 2000). Locations of colonies surveyed were then displayed against the 2000 Gap Analysis of Louisiana habitat data (USGS 2000) modified with coastal marsh salinity-type data from Chabreck et al. (2001). From this procedure we assigned a habitat type to each colony location. We used the GIS-generated habitat data to determine colony distribution by habitat type, and to calculate total area of available habitat by classification within the study area. For coastal marsh data, colony locations were assigned to one of the four marsh types, even if the actual location was in scrub/shrub or sand/shell/beach habitat type within the larger marsh zone.

From airplane track files (spatial locations along with time coding recorded by the GPS moving map system every 5 seconds) we determined the total distance surveyed for each habitat type. From those data we calculated the total area surveyed by habitat type (assuming 400-m [0.25 mi.] swath width). The total area surveyed was divided by total area for each habitat type within the study area to estimate percent of each habitat type that was surveyed. We then used the percent surveyed to estimate the number of colonies in unsurveyed habitats based on the number of new colonies found in each habitat type. For this calculation we combined all forested and scrub/shrub habitat types so that no estimates were obtained from habitats that were sampled by <5% of the total for the study area. From the number of known colonies in surveyed habitats, plus the estimated number of colonies in unsurveyed habitats, we estimated the total number of colonies in the study area.

To assess changes in colonial bird populations over time we compared results from this survey to data from earlier studies (Portnoy 1977, 1978a; Keller et al. 1984; Martin and Lester 1990). For this report, however, we conducted no statistical analyses and thus can make no inferences as to significance of observed differences. In addition, areas surveyed, timing of surveys, and number of surveys differed among years, therefore comparisons should be made with caution. For instance, summaries in Portnoy (1977) and Keller et al. (1984) included data from 19 and 25 (respectively) colonies in coastal Mississippi and Alabama; summaries from Martin and Lester (1990) were for Louisiana only, but also included six colonies in north Louisiana (north of 31 degrees latitude). Our study did not include colonies in Mississippi, Alabama, or north Louisiana. Portnoy (1977) also conducted various aerial and ground surveys from February through August, and then reported peak populations for each colony. Subsequent reports, however, were based on surveys conducted only in April, May, and June, so peak numbers were probably underestimated. And finally, Portnoy (1977, 1978a) reported colony size in terms of total numbers of individual adult birds (i.e., 2 x number of nests), whereas subsequent studies reported the number of nesting adult birds present on the colony at the time of the survey (equivalent to number of nests or nesting pairs, assuming one bird of each pair was usually out foraging away from the colony when the count was made). We verified this difference in reporting methods by comparing total numbers, by species, for saline marsh in Portnoy (1977, Table 4, page 38) with those presented in Portnoy (1978b, Table 2, page 232) for the same survey; values in the 1977 report (individuals) are twice those in the 1978 report (nests) for each species. Because of this difference, we adjusted the numbers from Portnoy (1977) and Portnoy (1978a) (i.e., we divided them by two) so that numbers would be comparable among years. This adjustment was applied to total number of birds by species, as well as to colony size classes for individual colony histories.

We hope to conduct a more detailed and rigorous analysis of existing data and present results from that analysis in a separate report, but such an analysis was beyond the scope of the current project.

## RESULTS AND DISCUSSION

We logged a total of 42.1 hours of flight time during seven days of aerial surveys (two airplanes) covering 3,230 linear nautical miles (Figure 2). Of the 496 colony sites surveyed, 299 (60%) were inactive and 197 (39%) were active (Table 1, Figure 3). Among the active nests, 123 (62.5%) were active at the known location, 38 (18.3%) were active known colonies that had moved to a new site but still within 1 km of the last surveyed position, and 36 (19.2%) were new colonies in new locations not previously recorded (Table 1).

We surveyed for colonies in 17 habitat types ranging from coastal aquatic communities to upland forested communities (Figure 4). Of the 197 active colonies observed, 167 (85%) of the colonies were found in either saline marsh (77 colonies), fresh marsh (48 colonies), or forested wetlands (44 colonies; Table 1). The remaining 15% were observed in wetland scrub/shrub, upland scrub/shrub, upland forested, intermediate marsh, or brackish marsh habitats.

We estimated a total of 215,249 pairs representing 25 bird species among the active nests (Table 2). Species occurring in the greatest of number of colonies were great egret (86 colonies), snowy egret (71 colonies), and laughing gull (58 colonies); all other species were present in less than 50 colonies (Figure 5). Species with the greatest total numbers of pairs (all colonies combined) were sandwich tern (38,258), laughing gull (34,717), cattle egret (28,037), and white ibis (24,036); all other species estimates were less than 20,000 pairs (Figure 6). Sandwich tern, cattle egret, royal tern, white ibis, and dark ibis had the highest mean colony size (>750 pairs per colony; Figure 7).

Most colonies were either small (<200 pairs; 46%) or medium sized (200-500 pairs, 23%; 500-3,000 pairs, 24.2%; Figure 8). Only 8% of the colonies were large (>3,000 pairs). The five largest colonies observed during the 2001 colony survey were located in saline marsh or forested wetlands (Table 3). Two colonies had populations of over 30,000 pairs, but all other colonies had less than 10,000 pairs. We found a high degree of site fidelity in the largest colonies from 1990 to 2001. In 1976, however, Portnoy (1978b) found at least six colonies on coastal islands that numbered 10,000 to 17,000 nests; only one of those (Colony No. 186, this study) was in our top five list of colonies with >8,000 nests (Table 3).

Habitats with the greatest colony densities (i.e., >1 colony per square nautical mile) were saline marsh (including associated sand/shell/beach and shrub habitats on coastal islands) and wetland scrub/shrub; all other habitats had densities of <1 (Table 4). Based on our total of 36 new colonies in all habitats surveyed, we estimated that an additional 289 colonies were present in unsurveyed areas, and, therefore, that the total number of active colonies in the study area was 486 (Table 5).

Of 15 species that had shown declines in total numbers of bird pairs from 1976 to 1990, eight continued to decline from 1990 to 2001, and seven were stable or showed an increase in 2001 (Figure 9). Wading bird species that showed the most pronounced decreases among the three survey years were great egret, little blue heron, tricolored heron, black-crowned night heron, and white ibis. Interestingly, black-crowned night

heron was the only one of those species that showed a decrease in the number of colonies over the same period (Figure 10), meaning that the decrease in numbers for the other four species was likely due to a decrease in number of pairs per colony, not the number of colonies. Nesting reddish egrets, reported in previous studies, were not found on our aerial surveys and hence were not reported herein, although they were noted (but not counted) by refuge personnel during ground counts at Breton NWR. Among the seabirds, black skimmers, Forster's terns, and laughing gulls showed pronounced decreases in numbers of pairs from 1976 to 1990, but not from 1990 to 2001 (Figure 9). Sandwich terns showed a lesser decrease during the first period, but continued to decrease during the second period. Brown pelicans, almost absent in 1976 (1 colony, 24 pairs), have shown a steady increase in number of pairs and number of colonies during successive surveys (2001: 13 colonies, 8352 pairs). Roseate spoonbills have shown a steady increase in the number of colonies, but the number of pairs has not increased appreciably over time. A more detailed look at colony data and population trends is warranted to determine if there have been actual changes in numbers of birds, or if the trends indicated herein are due to methodology differences among the three studies.

In our dataset, 209 colony sites (all species) had historical data for at least two survey years from 1976 to 2001. Of those, 37 (17.7%) sites were abandoned and then re-colonized (see Appendix C). Martin and Lester (1990, page 29) present summary data comparing their study with previous studies from 1976 and 1983. Those data appear to have been adjusted so that they consider only colonies in south Louisiana, excluding those in Mississippi, Alabama, and north Louisiana; therefore, they may differ from values published in previous reports. We used the summary data reported by Martin and Lester (1990) to evaluate overall trends among the four survey years. We found the number of active colonies in 1976, 1983, 1990, and 2001 to be fairly stable (148, 188, 192, and 197 colonies, respectively), especially in the years after the initial survey, although the number of colony sites surveyed increased over time (168, 247, 356, and 496) due to the addition of new colonies each survey year. The total number of pairs, however, decreased sharply with the current survey (from 373,000; 415,000; and 350,000 pairs in previous years down to 215,000 pairs in 2001). The apparent decrease should not be considered real until a more detailed and rigorous quantitative evaluation has been conducted, including statistical analysis and evaluation of trends by species and by geographic area.

## MANAGEMENT CONCERNS

Louisiana is fortunate in having one of the best, if not the best, waterbird colony dataset in North America. The dataset has been maintained and updated based on periodic surveys between 1976 and 2001. Federal, State, and university researchers and managers have been involved in this effort. Methods for the various surveys have been fairly consistent. Periodic surveys should continue, and perhaps increase in frequency. Experimental studies to test assumptions inherent in these surveys should be conducted to determine visibility biases by species and habitat, effect of timing, accuracy and precision.

Although the number of active colonies within the study area appears to have been fairly stable over time (1976-2001), the total number of birds and estimates for several individual species appears to have decreased. The trends shown in this report should not be viewed as real at this time, but they should raise concern among managers. It is clear from the numbers presented herein that a more detailed analysis of all colony data is in order, and such an analysis would clarify management concerns and options. Such a study should include statistical analysis by species and habitat type, and detailed tracking of the individual colonies for which data exist over time. Rates of colony site use, abandonment, and re-establishment, and factors affecting those behaviors, should be included. Habitat change within the study area should also be considered as a possible factor in colony population dynamics. An attempt should be made to determine if population changes are due to factors within the study area, to continental or regional factors, or to both. If intrinsic factors play a major role, then management options should be enumerated and action items considered.

## ACKNOWLEDGMENTS

Funding for this survey was provided by U.S. Fish and Wildlife Service, Ecological Services, Lafayette, Louisiana (Project Leader, David Fruge); Barataria-Terrebonne National Estuary Program, Cocodrie, Louisiana (Project Officer, Richard deMay); and by USGS, National Wetlands Research Center, Lafayette, Louisiana. Paul LeBerg, University of Louisiana at Lafayette, assisted in project planning. Fred Roetker, U.S. Fish and Wildlife Service, piloted a second aircraft on some of the surveys. Ground surveys were conducted on national wildlife refuges (NWRs) and colony data were provided by Ben Mense (Sabine NWR), Glen Harris (Cameron Prairie NWR), Wayne Syron (Lacassine NWR), Janet Ertel (Mandalay NWR), Nancy Walters (Bayou Sauvage, Big Branch, Bogue Chitto, and Delta NWRs), and James Harris (Breton NWR). Jeremy Reiser, Christopher Courville, Rebecca Moss, and Patricia Lavin provided technical support in terms of data transcription and management, and production of text for the report. Beth Vairin, Paul LeBerg, and Richard deMay provided critical review comments to the manuscript.

Wetland scrub/shrub - mixed			1	1	2	2
Total	299	123	38	36	496	197

\* Colony codes

1 = Inactive colony, old location

2 = Active colony, old location

3 = Active colony, new location

4 = New colony, new location

Table 2. Abundance of colonial-nesting waterbirds in active colonies of south Louisiana, 2001.

<b>Species</b>	<b>Number of colonies</b>	<b>Number of pairs</b>	<b>Mean # pairs / colony</b>
Great blue heron	35	2,019	58
Little blue heron	43	7,804	181
Tricolored heron	21	410	20
Yellow-crowned night heron	2	21	11
Green heron	4	85	21
Black-crowned night heron	15	329	22
Great egret	86	13,928	162
Cattle egret	26	28,037	1,078
Snowy egret	71	17,674	249
Brown pelican	13	8,352	642
Herring gull	1	2	2
Laughing gull	58	34,717	599
Black skimmer	20	2,905	145
Roseate spoonbill	21	1,168	56
Forsters tern	19	2,690	142
Caspian tern	11	682	62
Sandwich tern	6	38,258	6,376
Royal tern	13	11,787	907
Least tern	2	80	40
Gull-billed tern	4	440	110
Ahinga	19	830	44
White ibis	21	24,036	1,145
Dark ibis <sup>1</sup>	22	18,473	840
Neotropical cormorant	8	522	65
All species	197	215,249	1093

<sup>1</sup> Includes glossy Ibis and white-faced Ibis.

Table 3. Five largest colonies observed during the 2001 colony survey.

<u>Colony number</u>	<u>Colony Coordinates</u>		<u>Parish</u>	<u>Location</u>	<u>Habitat type</u>	<u>Species present</u>	<u>Number of nesting adult pairs</u> <sup>1</sup>	<u>1990 top five colonies</u> <sup>2</sup>
	<u>Latitude</u>	<u>Longitude</u>						
83	29.5333	-89.0833	Plaquemines	South Gosier Island	Saline marsh	BRPE, BLSK, SATE, ROTE	38,655	Y
227	30.7400	-92.3453	Evangeline	Miller's Lake	Wetland forest - deciduous	CAEG, DAIB, LBHE, SNEG, ANHI, WHIB	37,520	Y
562	30.3631	-90.3584	Tangipahoa	Joyce Wildlife Management Area	Wetland forest - deciduous	WHIB	9,500	N*
186	29.0525	-90.9338	Terrebonne	Raccoon Island	Saline marsh	GREG, BRPE, LAGU, SATE	9,005	Y
228	30.2128	-91.9019	St. Martin	Lake Martin	Wetland forest - deciduous	ROSP, CAEG, GREG, LBHE	8,020	Y

<sup>1</sup> See appendix A for species abbreviation codes.

<sup>2</sup> All species combined.

<sup>3</sup> Y= colonies were listed in top five by Martin and Lester (1990).

\* believed to be equivalent to colony number 268 (1990) and 167(1983, 1976) but location of new colony >1km from previous locations, so new colony number and location assigned.

Table 4. Total distance and habitat surveyed during 2001 colony survey in south Louisiana.

Habitat land cover	# of points	% of total points	Habitat covered (nautical miles)	Total habitat surveyed (square nautical miles)	Total habitat in study area (sq. n. mi.)	% coverage per habitat	# active colonies per habitat	# active colonies per sq. n. mi of surveyed area

sq. n. mi. = square nautical mile

Spreadsheet Equation Formulas for Column Headings:

A = Combined Habitat (see Table 4).

B = Number of points in each habitat from flight tracks (points are five seconds apart).

C = B / 14028 (total # of points).

D = C \* 3230 (total miles flown; see Table 4).

E = D \* 0.25 (transect width).

F = Calculated from GIS (see Figure 1).

G = E / F.

H = From Table 1.

I = H / E.

J = From Table 1.

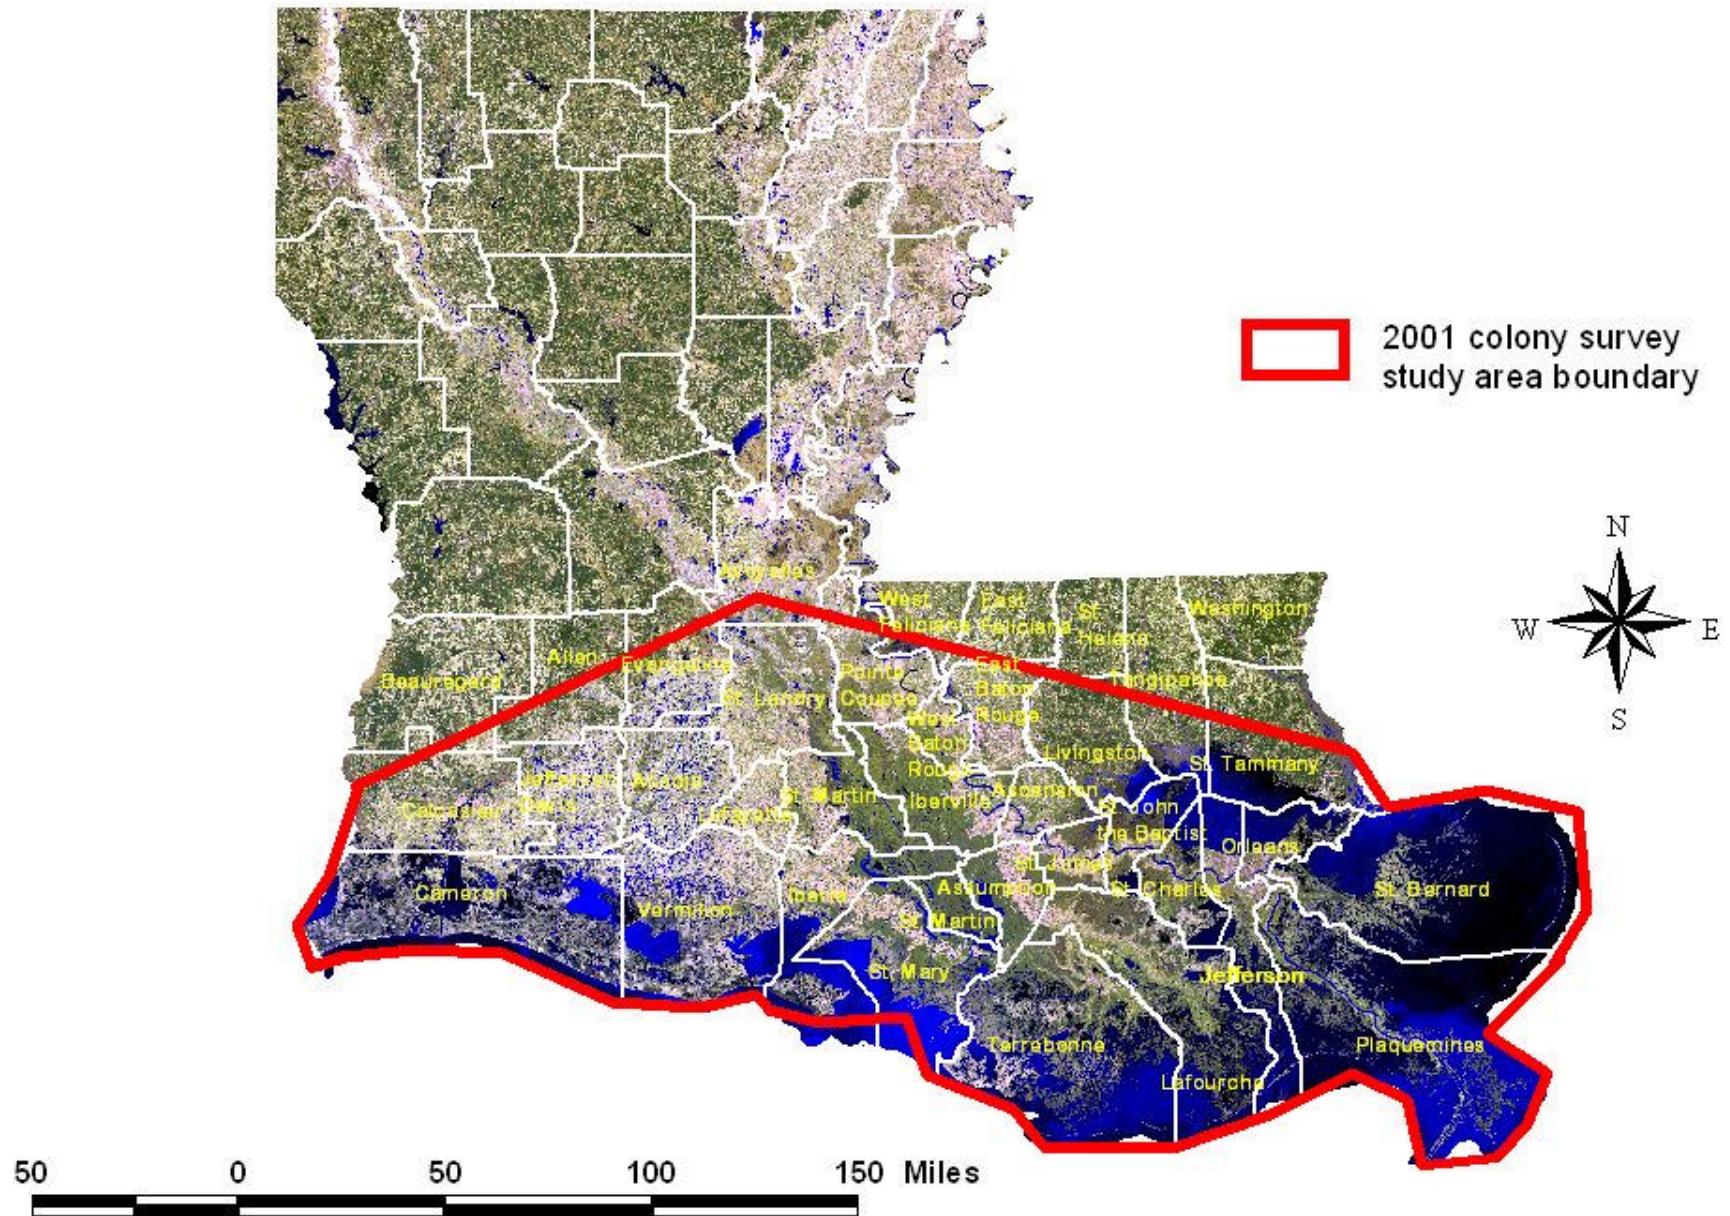

K = J / E.

L = K \* F.

M = L - J.

N = M + H.

Appendix A. Species and abbreviation codes used for the 2001 Colony Survey.

<b>Abbreviation Code</b>	<b>Common Name</b>	<b>Scientific Name</b>
GBHE	Great blue heron	<i>Ardea herodias</i>
LBHE	Little blue heron	<i>Egretta caerulea</i>
TRHE	Tricolored heron	<i>Egretta tricolor</i>
YCNH	Yellow-crowned night-heron	<i>Nyctanassa violacea</i>
GNHE	Green heron	<i>Butorides virescens</i>
BCNH	Black-crowned night-heron	<i>Nycticorax nycticorax</i>
GREG	Great egret	<i>Ardea alba</i>
CAEG	Cattle egret	<i>Bubulcus ibis</i>
SNEG	Snowy egret	<i>Egretta thula</i>
BRPE	Brown pelican	<i>Pelecanus occidentalis</i>
HERG	Herring gull	<i>Larus argentatus</i>
LAGU	Laughing gull	<i>Larus atricilla</i>
BLSK	Black skimmer	<i>Rynchops niger</i>
ROSP	Roseate spoonbill	<i>Platalea ajaja</i>
FOTE	Forsters tern	<i>Sterna forsteri</i>
CATE	Caspian tern	<i>Sterna caspia</i>
SATE	Sandwich tern	<i>Sterna sandvicensis</i>
ROYT	Royal tern	<i>Sterna maxima</i>
LETE	Least tern	<i>Sterna antillarum</i>
GBTE	Gull-billed tern	<i>Sterna nilotica</i>
ANHI	Anhinga	<i>Anhinga anhinga</i>
WHIB	White ibis	<i>Eudocimus albus</i>
DAIB	Dark ibis	<i>Plegadis spp.</i>
NECO	Neotropic cormorant	<i>Phalacrocorax brasiliensis</i>

Appendix B. Colonies that were active in 2001, including number of pairs by species and totals by colony and by species; see appendix A for list of species abbreviations.

**All colonies are active - No inactive colonies displayed**

New colonies start with #562

**Codes for colonies with letter designations for numbers:**

A: Colony is active, but no species or counts given

B: Colony is active, species given, but no counts

\*\*Colony number is the same as ECOCODE in LDWF database

Appendix C. Complete list of colonies surveyed in 2001 sorted by colony number, including last survey date, coordinates, species present, colony status, habitat, and colony history.

COLONY NUMBER = "LNHP code" of Martin and Lester (1990) and "ECOCODE" used in current colony database (see Martin and Lester 1990 to cross reference with earlier reports).

LASTOBS = Last date that the colony was observed as active.

LASTSVY = Last date that the colony site was surveyed.

LATDEC = Latitude in decimal degrees.

LONGDEC = Longitude in decimal degrees (\* -1).

STATUS CODE: 1 = Inactive colony, old location

2 = Active colony, old location

3 = Active colony, new location

4 = New colony, new location

PARISH - see Figure 1.

HISTORY is presented for colonies up to number 305, current through 1990. Colonies numbered 306-356 do not correspond to those same numbers from Martin and Lester (1990) -- those numbers were reassigned to new colonies after 1990. Colonies numbered 357-561 were added during partial surveys between 1991 and 1999. New colonies from 2001 begin with colony number 562. Size classes from 1976 and 1978 were changed from previous reports to reflect pairs, not total adult birds (see text).

HISTORY CODES: \* = Colony not surveyed

0 = No nesting activity

1 = 2 to 100 pairs present

2 = 100 to 500 adult birds present

3 = 500 to 1000 pairs present

4 = 1000 to 5000 pairs present

5 = 5000 to 10000 pairs present

6 = 10000 to 15000 pairs present

7 = over 15000 pairs present

11 = Colony is active, but species or counts unknown

Total	298	123	39	36	496	198

## \* Colony Codes

1 = Inactive colony, old location

2 = Active colony, old location

3 = Active colony, new location

4 = New colony, new location

Table 2

Table 2. Abundance of colonial-nesting waterbirds in active colonies of south Louisiana, 2001.

Species	Number of colonies	Number of pairs	Mean # pairs / colony
Brown Pelican	14	8,477	606
Cormorant <sup>1</sup>	8	522	65
Anhinga	19	830	44
Great Blue Heron	35	2,019	58
Great Egret	86	13,928	162
Snowy Egret	72	19,674	273
Little Blue Heron	43	7,804	181
Tricolored Heron	21	410	20
Cattle Egret	26	26,037	1001
Green Heron	4	85	21
Black-crowned Night-Heron	15	329	22
Yellow-crowned Night-Heron	2	21	11
White Ibis	21	24,036	1145
Dark Ibis <sup>2</sup>	22	18,473	840
Roseate Spoonbill	21	1,168	56
Laughing Gull	59	35,532	602
Herring Gull	1	1	1
Gull-billed Tern	4	440	110
Caspian Tern	11	682	62
Royal Tern	14	12,422	887
Sandwich Tern	6	38,258	6376
Forster's Tern	19	2,690	142
Least Tern	2	80	40
Black Skimmer	20	2,905	145
All species	198	216,823	1095

<sup>1</sup> Includes Neotropic Cormorant and Double-crested Cormorant.

<sup>2</sup> Includes Glossy Ibis and White-faced Ibis.

## Atlas and Census of Wading Bird and Seabird Nesting Colonies in South Louisiana, 2001

Table 3. Five largest colonies observed during the 2001 colony survey.

<u>Colony number</u>	<u>Colony Coordinates</u>		<u>Parish</u>	<u>Location</u>	<u>Habitat type</u>	<u>Species present</u>	<u>Number of nesting adult pairs</u> <sup>1</sup>	<u>1990 top five colonies</u> <sup>2</sup>
	<u>Latitude</u>	<u>Longitude</u>						
83	29.5333	-89.0833	Plaquemines	South Gosier Island	Saline marsh	BRPE, BLSK, SATE, ROTE	38,655	Y
227	30.7400	-92.3453	Evangeline	Miller's Lake	Wetland forest - deciduous	CAEG, DAIB, LBHE, SNEG, ANHI, WHIB	37,520	Y
562	30.3631	-90.3584	Tangipahoa	Joyce Wildlife Management Area	Wetland forest - deciduous	WHIB	9,500	N*
186	29.0525	-90.9338	Terrebonne	Raccoon Island	Saline marsh	GREG, BRPE, LAGU, SATE	9,005	Y
228	30.2128	-91.9019	St. Martin	Lake Martin	Wetland forest - deciduous	ROSP, CAEG, GREG, LBHE, SNEG	8,020	Y

<sup>1</sup> See appendix A for species abbreviation codes.							
<sup>2</sup> All species combined.							
<sup>3</sup> Y= colonies were listed in top five by Martin and Lester (1990).							
* believed to be equivalent to colony number 268 (1990) and 167(1983, 1976) but location of new colony >1km from previous locations, so new colony number and location assigned.

Spreadsheet Equation Formulas for Column Headings:

A = Combined Habitat (see Table 4)

B= Number of points in each habitat from flight tracks (points are five seconds apart)

C = B / 14028 (total # of points)

D = C \* 3230 (total miles flown; see Table 4)

E = D \* 0.25 (transect width)

F = Calculated from GIS (see Figure 1)

G = E / F

H = From Table 1

I = H / E

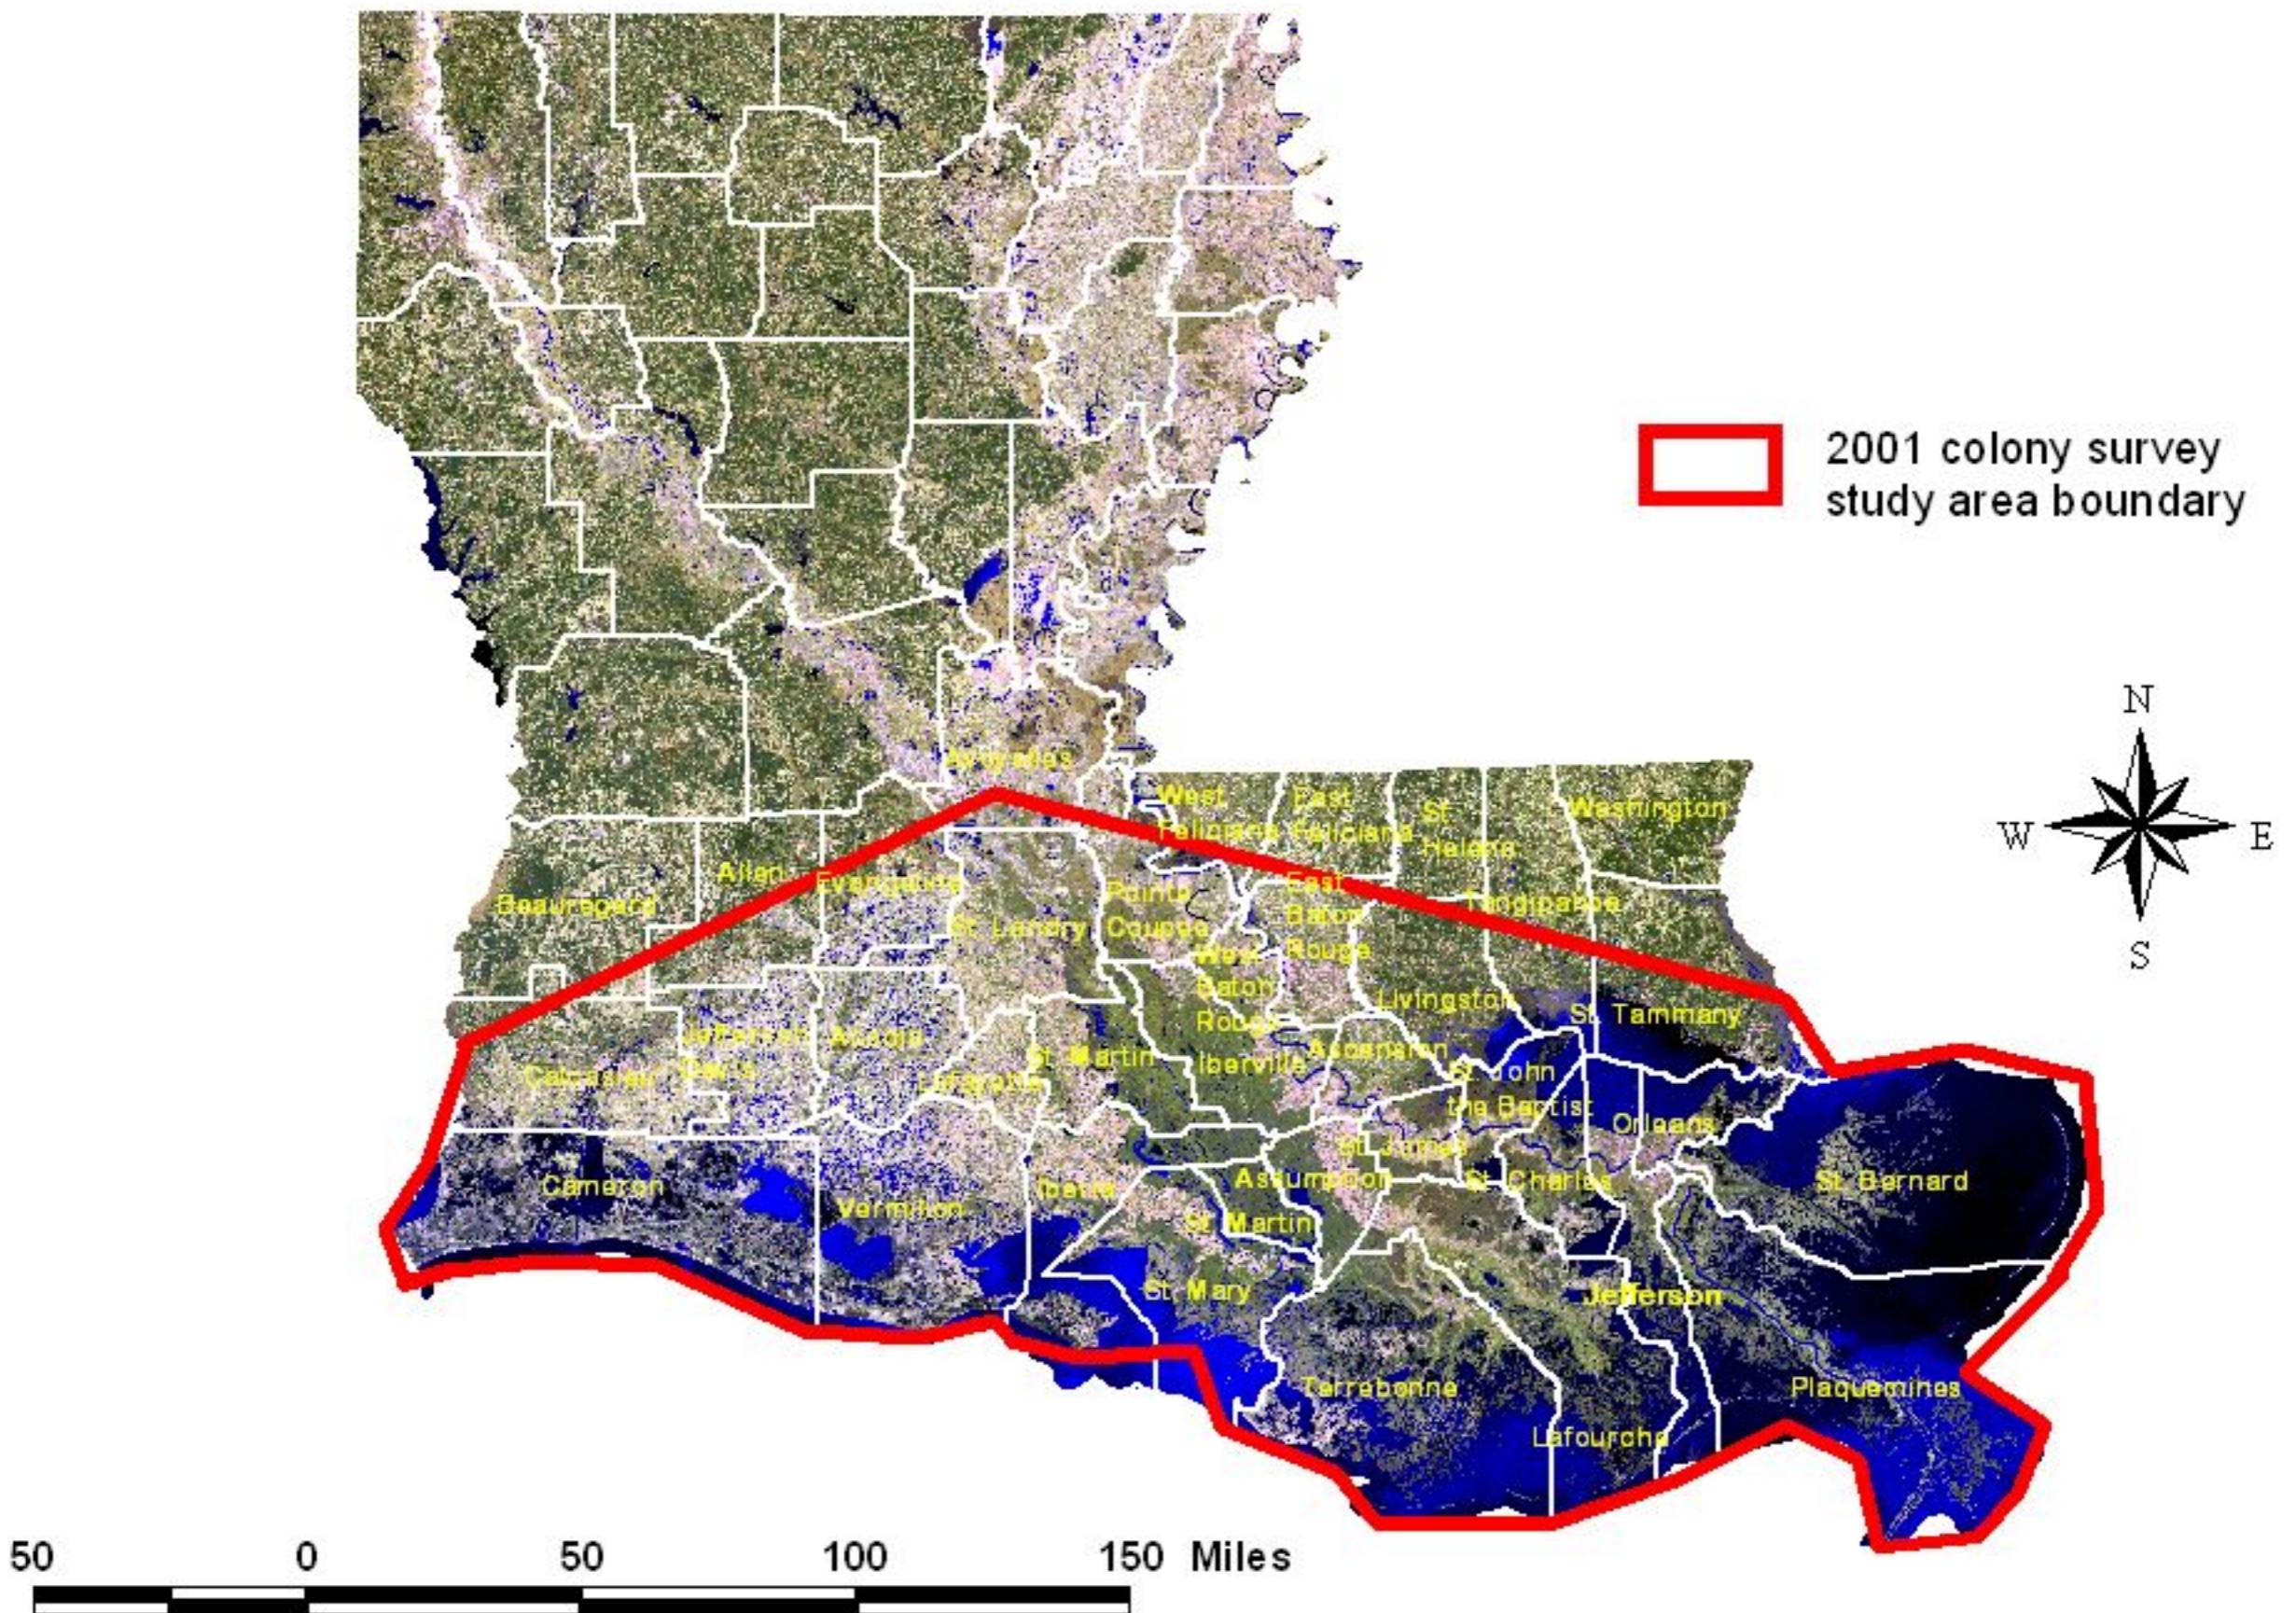

J = From Table 1

K = J / E

L = K \* F

M = L - J

N = M + H

# Atlas and Census of Wading Bird and Seabird Nesting Colonies in South Louisiana, 2001

Appendix A. Species and abbreviation codes used for the 2001 Colony Survey.

<u>Abbreviation Code</u>	<u>Common Name</u>	<u>Scientific Name</u>
BRPE	Brown Pelican	<i>Pelecanus occidentalis</i>
CORM	Cormorant	<i>Phalacrocorax</i> spp.
ANHI	Anhinga	<i>Anhinga anhinga</i>
GBHE	Great Blue Heron	<i>Ardea herodias</i>
GREG	Great Egret	<i>Ardea alba</i>
SNEG	Snowy Egret	<i>Egretta thula</i>
LBHE	Little Blue Heron	<i>Egretta caerulea</i>
TRHE	Tricolored Heron	<i>Egretta tricolor</i>
CAEG	Cattle Egret	<i>Bubulcus ibis</i>
GNHE	Green Heron	<i>Butorides virescens</i>
BCNH	Black-crowned Night-Heron	<i>Nycticorax nycticorax</i>
YCNH	Yellow-crowned Night-Heron	<i>Nycticorax violaceus</i>
WHIB	White Ibis	<i>Eudocimus albus</i>
DAIB	Dark Ibis	<i>Plegadis</i> spp.
ROSP	Roseate Spoonbill	<i>Platalea ajaja</i>
LAGU	Laughing Gull	<i>Larus atricilla</i>
HERG	Herring Gull	<i>Larus argentatus</i>
GBTE	Gull-billed Tern	<i>Sterna nilotica</i>
CATE	Caspian Tern	<i>Sterna caspia</i>
ROYT	Royal Tern	<i>Sterna maxima</i>
SATE	Sandwich Tern	<i>Sterna sandvicensis</i>
FOTE	Forster's Tern	<i>Sterna forsteri</i>
LETE	Least Tern	<i>Sterna antillarum</i>
BLSK	Black Skimmer	<i>Rynchops niger</i>

## Atlas and Census of Wading Bird and Seabird Nesting Colonies in South Louisiana, 2001

Appendix B. Colonies that were active in 2001, including number of pairs by species and totals by colony and by species; see appendix A for list of species abbreviations.

**All Colonies are active - No inactive colonies displayed**

**New colonies start with #562**

**Codes for colonies with letter designations for numbers**

A: Colony is active, but no species or counts given

B: Colony is active, species given, but no counts

\*\*Colony number is the same as ECOCODE in LDWF database.

Appendix C. Complete list of colonies surveyed in 2001 sorted by colony number, including last survey date, coordinates, species present, colony status, habitat, and colony history.

COLONY NUMBER = "LNHP code" of Martin and Lester (1990) and "ECOCODE" used in current colony database (see Martin and Lester 1990 to cross reference with earlier reports).

LASTOBS = Last date that the colony was observed as active.

LAST\_SVY = Last date that the colony site was surveyed.

LATDEC = Latitude in decimal degrees.

LONGDEC = Longitude in decimal degrees (\* -1).

STATUS CODE: 1 = Inactive colony, old location

2 = Active colony, old location

3 = Active colony, new location

4 = New colony, new location

PARISH - see Figure 1.

HISTORY is presented for colonies up to number 305, current through 1990. Colonies numbered 306-356 do not correspond to those same numbers from Martin and Lester (1990) -- those numbers were reassigned to new colonies after 1990. Colonies numbered 357-561 were added during partial surveys between 1991 and 1999. New colonies from 2001 begin with colony number 562. Size classes from 1976 and 1978 were changed from previous reports to reflect pairs, not total adult birds (see text).

HISTORY CODES: \* = Colony not surveyed

0 = No nesting activity

1 = 2 to 100 pairs present

2 = 100 to 500 pairs present

3 = 500 to 1000 pairs present

4 = 1000 to 5000 pairs present

5 = 5000 to 10000 pairs present

6 = 10000 to 15000 pairs present

7 = over 15000 pairs present

11 = Colony is active, but species or counts unknown
